EAS System Checker

By simulating a 58kHz tag signal at the touch of a button, it allows store personnel to verify gate functionality remotely and instantly.

The AM System Checker is a professional-grade diagnostic and security tool designed for AM EAS systems.

Beyond system testing, it serves as a manual alarm trigger, providing managers with a discreet method to activate entrance pedestals to deter suspicious activity or signal for floor assistance.

Remote diagnostic capability: Perform daily "Morning Startup" protocols without needing to walk through the gates with a physical tag.

On-demand deterrence: Manually trigger the EAS alarm from the sales floor or back office to interrupt potential theft.

Wall-Mounted Stability: Designed for permanent installation near the antenna field to ensure consistent signal calibration.

Dual-Remote Access: Includes two pre-paired, long-range remotes for multiple staff members or multi-point control.

Universal AM Compatibility: Works with all standard 58kHz AM pedestals regardless of manufacturer.
